A regular user would open the application and see the list of the active processes. After that they can access either the whole process list or the search function.

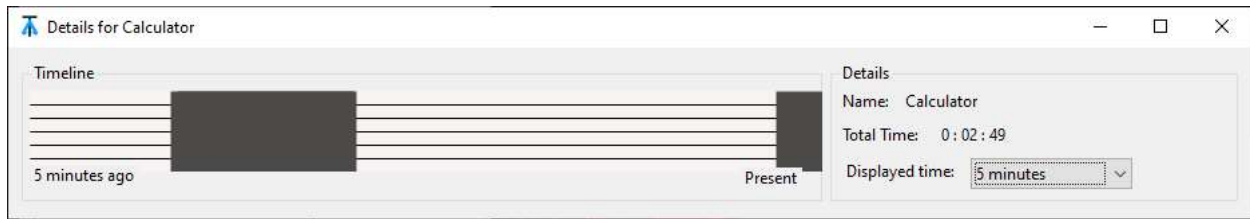

There is also the possibility of sorting the list ascending or descending.

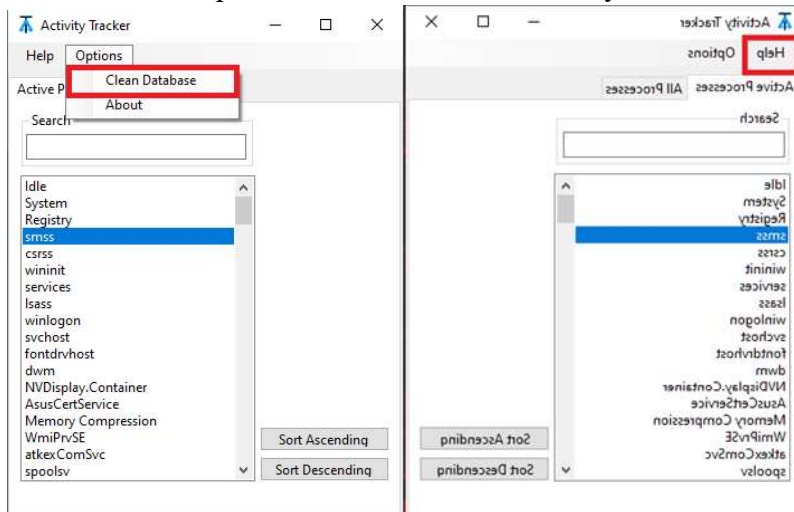

The user can also search for a specific process and if said process is pressed twice the application will open a second window where the process timeline will be seen and also the total time that the project was active.

If the user wills it they can use the help option located at the top of the main window and read more about the application. There is also the options menu which provides the user with a clean database option, which clears the memory and the about section of the app.

When the user closes the application a message prompt will appear notifying them that the application can be minimized in the system tray for continuous recording of the processes that are used.
